DRYING SYSTEMS FOR GRANULATES AND POWDER

Drying

DRYING SYSTEMS FOR GRANULATES AND POWDER

We offer drying technologies for granulates and powder in terms of surface moisture, as well as in terms of capillary moisture. Since every product has its own processing requirements, we work with a variety of drying technologies and thus can assure you that we treat each product with the best suited drying method.

We apply common conventional systems such as fluidized bed driers, drying cabinets, belt driers and vacuum driers. In addition, we also work with innovative methods such as infrared or microwave drying.

For the exact analysis of the exhaust and residual moisture of your products we use several types of appropriate measuring instruments and methods. At the moment, we work with the following measuring systems: Karl Fischer titration, Satorius moisture meters and Hydro Tracers. You have the possibility for a clear comparison of our measured data with your own laboratory test values.

We help improving the quality of your products and offer to test new and innovative (drying) methods for you. We optimize your production processes by integrating these methods and thus help increasing the efficiency of your work.
